

What is claimed is:

1. A touch-control floor lamp comprising a seat, a hollow supporting post extended from the seat, and a secondary light base and a main light base at an upper end of the supporting post, with the secondary light base and the main light base disposed with light bulbs; and
5 being characterized that, the secondary light base and the main light base are both controlled by a touch-control switch having an integrated circuit therein, and the integrated circuit is connected to the secondary light base and the main light base via double-loop
10 control wires.
2. The touch-control floor lamp according to claim 1, wherein the touch-control switch is located in the hollow structure of the supporting post, and is connected with the supporting post via a touch-control wire for electrically connecting the supporting post,
15 thereby switching on and off the light bulbs at the secondary light base and the main light base in a secondary-to-main sequence.
